

Introduction to Java II

Overview

- Today we will cover Java **identifiers**, **classes** and **objects**.
- We will also review the object-oriented concept of **inheritance**.
- We will apply what we learn in an example Java program that will be compiled and run from the **Eclipse IDE** and **command-line**.

Introduction to Java

- In the Java programming language
 - a program is made up of one or more *classes*
 - a class contains one or more *methods*
 - a method contains program *statements*
- These terms will be explored in detail throughout the course
- A Java application always contains a method called `main`

Introduction to Java

Identifiers

- **Identifiers** are the words a programmer uses in a program
- Java is **case sensitive**
 - Total, total, and TOTAL are different identifiers
- We use special identifiers called **reserved words** that already have a predefined meaning in the language.
 - A reserved word cannot be used in any other way

Introduction to Java

Reserved Words

<code>abstract</code>	<code>else</code>	<code>interface</code>	<code>switch</code>
<code>assert</code>	<code>enum</code>	<code>long</code>	<code>synchronized</code>
<code>boolean</code>	<code>extends</code>	<code>native</code>	<code>this</code>
<code>break</code>	<code>false</code>	<code>new</code>	<code>throw</code>
<code>byte</code>	<code>final</code>	<code>null</code>	<code>throws</code>
<code>case</code>	<code>finally</code>	<code>package</code>	<code>transient</code>
<code>catch</code>	<code>float</code>	<code>private</code>	<code>true</code>
<code>char</code>	<code>for</code>	<code>protected</code>	<code>try</code>
<code>class</code>	<code>goto</code>	<code>public</code>	<code>void</code>
<code>const</code>	<code>if</code>	<code>return</code>	<code>volatile</code>
<code>continue</code>	<code>implements</code>	<code>short</code>	<code>while</code>
<code>default</code>	<code>import</code>	<code>static</code>	
<code>do</code>	<code>instanceof</code>	<code>strictfp</code>	
<code>double</code>	<code>int</code>	<code>super</code>	

Introduction to Java – Classes

- An object is defined by a *class*
- A class is the blueprint of an object. The class uses methods to define the behaviors of the object
- The class that contains the **main** method of a Java program represents the entire program
- A class represents a concept, and an object represents the embodiment of that concept
- Multiple objects can be created

Introduction to Java – Classes

Classes:

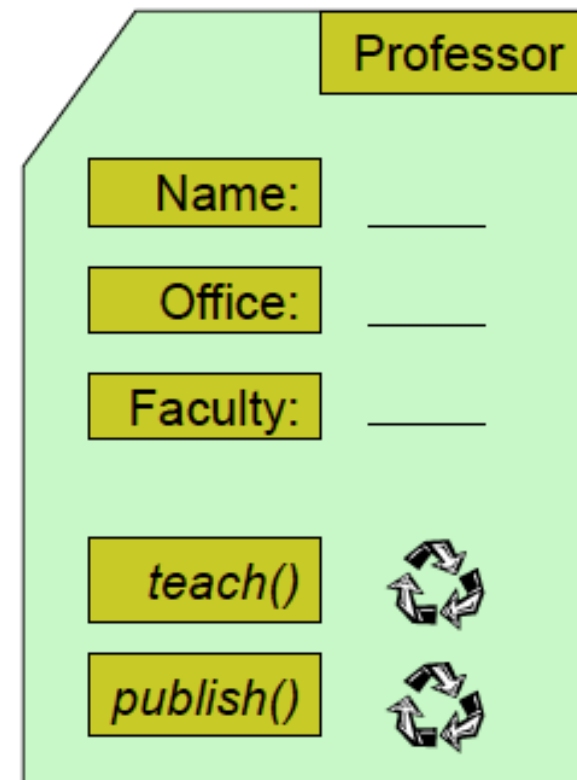

Blueprint of the “layout” of objects.

- Members (data)
- Methods (code)

Writing classes involves

- Declare the members
- Declare the methods
- Write code to implement the methods

Classes are created when you write your Java code.

Introduction to Java – Objects

- Java code can create objects by
 - **Directly**: invoke constructors that are available to a certain class.
 - **Indirectly**: invoke a method which will in turn create an object and return that object.
- The only way to access Java objects is by **variables** which are **pointers** to the object.

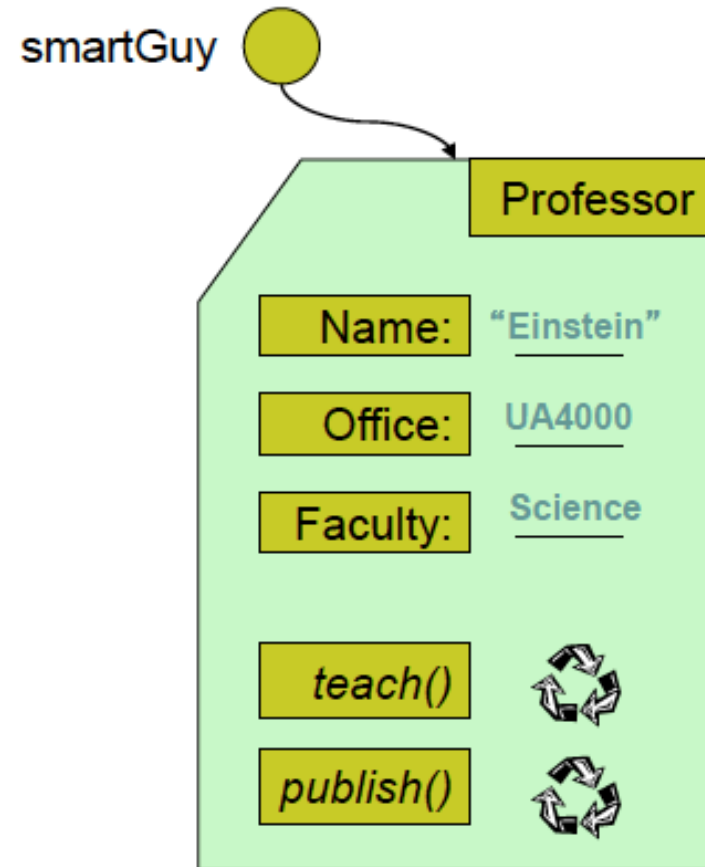

Introduction to Java – Objects

Objects:

Variables of a class containing

- members (data)
- Methods (code)

Objects are created when you run your program. This is called “run-time”.

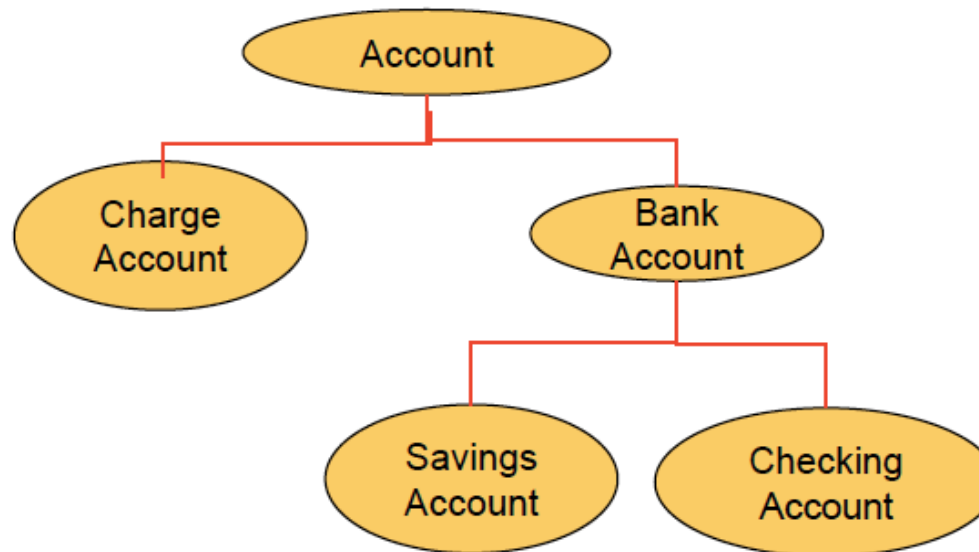

Introduction to Java

- Let's now look at an example!

See [FirstProgram.java](#) and [Triangle.java](#) for a first example of a Java program and Java classes.

OO Principles - Inheritance

- One class can be used to derive another via **inheritance**
- Classes can be organized into **hierarchies**

Introduction to Java II

Summary

- Today we covered Java **identifiers**, **classes** and **objects** and reviewed **inheritance**.
- We also learned how to compile and run a Java program from the **Eclipse IDE** and **command-line**.

Next time

- We will talk about Java data types, variables and expressions
