University/College Poster Session

Advanced Plasma Engineering Lab

With the support from UOIT and APEL lab members, the student team participated in the OAC event today and presented our work titled: Ion-Thrusters for Aerospace Applications, where our plasma technology is used to improve the thrust to power ratio with reduced fuel mass and consumption to support spaceship missions, with minimum cost.

We had great discussions with excellent feedback from attendees with high interests from industries and academia. We will plan to expand this experimental work with prototyping and test within ACE facility.
